

Assignment 11 – text answers

Exercise 1

We will start with a basecase: fact (1).

The program will compute:

$1 * \text{fact}(1-1)$

Since the integer 0 is less than 1, integer 1 is returned to function.

Our next case is fact(2)

The program will compute:

$2 * \text{fact}(2-1)$

Which gives us the result 2 since $2 * 1 * \text{fact}(1-1) = 2 * 1 = 2$

Our next case is fact(3)

The program will compute:

$3 * \text{fact}(3-1)$

Which is:

$3 * 2 * \text{fact}(2-1)$

Which gives us the result 6 since $3 * 2 * 1 = 6$

We can conclude that the function computes $\text{fact}(n) = n * (n-1) * \dots * (n-n+1)$.
